

Kubernetes Task

Task Description:

Setup minikube at your local and explore creating namespaces (Go through official documentation).

Techstacks needs to be used :

- Vbox, WSL
- Docker
- Minikube
- Kubectl

If the Local system has any issues you can use AWS.

- AWS EC2 (t2.medium)

```

The image shows a Visual Studio Code (VS Code) window with a terminal open. The terminal is running a `kubectl port-forward` command to forward traffic from a pod to a local port. The output shows that the forwarding is successful, with connections being handled from both 127.0.0.1 and ::1.

```
Jawahar@Jawahar:~/kubernetes$ kubectl port-forward pod/my-nginx-5b584c864b-8hggv 8080:80
Forwarding from 127.0.0.1:8080 -> 80
Forwarding from [::1]:8080 -> 80
Handling connection for 8080
Handling connection for 8080
```

The VS Code interface includes a sidebar on the left with icons for Explorer, Search, Source Control, Run and Debug, and Extensions. The top of the window has a menu bar (File, Edit, Selection, View, Go, Run, ...) and a search bar. The bottom status bar shows the current file is an SSH connection to 192.168.1.10, along with system information like temperature (34°C Sunny) and the date/time (12:37:12 PM 07-06-2023).
